

OVERHAUL OF INDUSTRIAL SERVICES AND SUPPLIES TO FACTORY UNIT.

Complete overhaul and refurbishment of main services to factory unit.

The electrical refurbishment included the installation of all three phase systems, complete refurbishment of all single phase circuits including ring mains and lighting circuits. In addition a new fire alarm system was designed, installed and commissioned.

The unit was also heavily dependant upon the use of compressed air. Here there was the installation of a new ring main for the complete building. This included pipe work (with the appropriate fall for condensate), traps, valved tees for extraction from the ring main etc.

Compressors dryers and filters were installed in a separate plant room. This included the installation of water condensate traps from the compressors and dryers to stop oily dischargers to the surface or foul drains.
